EXAMINER

SMITH, JOSHUA Y

ART UNIT

PAPER NUMBER

2619

MAIL DATE

DELIVERY MODE

03/24/2008

PAPER

Please find below and/or attached an Office communication concerning this application or proceeding.

The time period for reply, if any, is set in the attached communication.

| | | | |
|------------------------------|--------------------------------------|--------------------------------------|--|
| Office Action Summary | Application No. 10/727,360 | Applicant(s) MISAWA ET AL. | |
| | Examiner JOSHUA SMITH | Art Unit 2619 | |

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --

Period for Reply

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

Status

- 1) ☒ Responsive to communication(s) filed on 03 December 2003.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

Disposition of Claims

- 4) ☒ Claim(s) 1-74 is/are pending in the application.
- 4a) Of the above claim(s) _____ is/are withdrawn from consideration.
- 5) ☐ Claim(s) _____ is/are allowed.
- 6) ☒ Claim(s) 1-74 is/are rejected.
- 7) ☐ Claim(s) _____ is/are objected to.
- 8) ☐ Claim(s) _____ are subject to restriction and/or election requirement.

Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☒ The drawing(s) filed on 03 December 2003 is/are: a) ☐ accepted or b) ☒ objected to by the Examiner.
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some * c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
2. ☐ Certified copies of the priority documents have been received in Application No. _____.
3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

* See the attached detailed Office action for a list of the certified copies not received.

DETAILED ACTION

Drawings

1. The drawings are objected to under 37 CFR 1.83(a) because they fail to show item labels “35” and “36” in FIG. 31, and item label “155” in FIG. 60, and item labels “137” and “155” in FIG. 61 as described in the specification. Any structural detail that is essential for a proper understanding of the disclosed invention should be shown in the drawing. MPEP § 608.02(d). Corrected drawing sheets in compliance with 37 CFR 1.121(d) are required in reply to the Office action to avoid abandonment of the application. Any amended replacement drawing sheet should include all of the figures appearing on the immediate prior version of the sheet, even if only one figure is being amended. The figure or figure number of an amended drawing should not be labeled as “amended.” If a drawing figure is to be canceled, the appropriate figure must be removed from the replacement sheet, and where necessary, the remaining figures must be renumbered and appropriate changes made to the brief description of the several views of the drawings for consistency. Additional replacement sheets may be necessary to show the renumbering of the remaining figures. Each drawing sheet submitted after the filing date of an application must be labeled in the top margin as either “Replacement Sheet” or “New Sheet” pursuant to 37 CFR 1.121(d). If the changes are not accepted by the examiner, the applicant will be notified and informed of any required corrective action in the next Office action. The objection to the drawings will not be held in abeyance.

Claim Objections

Claims 8, 23, 30, 31, 52, 53, 54, 55 and 56 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims have not been further treated on the merits.

Claims 9, 10, 18, 21, 25, 33, 39, 47, 57, 69 and 74 are objected to under 37 CFR 1.75(c) as being in improper form because a multiple dependent claim should refer to other claims in the alternative only and cannot depend from any other multiple dependent claim. See MPEP § 608.01(n). Accordingly, the claims have not been further treated on the merits.

Claim Rejections - 35 USC § 112

2. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

Claims 5 and 6 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claims 5 and 6 include “**a retrieving section a vacancy of the converting section**”. This is indefinite because it is uncertain how a retrieving section is involved with a vacancy of a converting section. Examiner will

examine Claims 5 and 6 such that the retrieving section **retrieves information indicating a vacancy** of the converting section.

Claim 16 is rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claim 16 includes “a notifying section for notifying a first signal type information”. This is indefinite because it is uncertain how a component (notifying section) can notify information (first signal format type information). Examiner will treat the statement to mean that the notifying section notifies a user’s device by **sending** a first signal format type information to a user’s device.

Claims 34 and 35 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention. Claims 34 and 35 include “a transmitting section the first signal format” and “a transmitting section the encapsulated signal”. This is indefinite because it is uncertain what “a transmitting section” is doing with “the first signal format”, or what “a transmitting section” is doing with “the encapsulated signal”. Examiner will treat the statements to mean that a transmitting section **processes** the first signal format, and a transmitting section **processes** the encapsulated signal.

Claim Rejections - 35 USC § 103

3. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

4. The factual inquiries set forth in *Graham v. John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

1. Determining the scope and contents of the prior art.
2. Ascertaining the differences between the prior art and the claims at issue.
3. Resolving the level of ordinary skill in the pertinent art.
4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

Claims 1-4, 7 and 32 are rejected under 35 U.S.C. 103(a) as being unpatentable over EP 1229692 in view of Morinaga et al. (Patent No.: US 6,785,263 B1) and Oguchi et al. (Pub. No.: US 2002/0067725 A1), hereafter referred to as the '692 reference, Morinaga, and Oguchi, respectively.

In regards to Claims 1 and 2, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is

mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, and a terminating device for containing the user's device). The '692 reference fails to teach a registering section from the user's device for a first signal format type which is used in the user's device, a retrieving section for a first signal format type which corresponds to information in a user's device according to a calling connection request from a user's device by referring to the information which is registered by the registering section, and a selecting section for selecting a first signal format which is used by the user's device according to a result in the retrieving section when data is transported from the user's device, user's device joins an virtual private network, IP address of a user's device and a VPNID, and a notifying section for notifying contents of a registration to other VPN terminating device which controls that same VPNID as the user's device. Morinaga teaches a registering section from the user's device for a first signal format type which is used in the user's device, a retrieving section for a first signal format type which corresponds to information in a user's device according to a calling connection request from a user's device by referring to the information which is registered by the registering section, and a selecting section for selecting a first signal

format which is used by the user's device according to a result in the retrieving section when data is transported from the user's device, Oguchi teaches user's device joins an virtual private network, IP address of a user's device and a VPNID, and a notifying section for notifying contents of a registration to other VPN terminating device which controls that same VPNID as the user's device.

In the same field of endeavor, Morinaga teaches in column 5, line 60 though column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a registering section from the user's device for a first signal format type which is used in the user's device, a retrieving section for a first signal format type which corresponds to information in a user's device according to a calling connection request from a user's device by referring to the information which is registered by the registering section, and a selecting section for selecting a first signal format which is used by the user's device according to a result in the retrieving section when data is transported from the user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the

invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information through a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (user's device joins a virtual private network, IP address of a user's device and a VPNID, and a notifying section for notifying contents of a registration to other VPN terminating device which controls that same VPNID as the user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claims 3 and 4, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for

Art Unit: 2619

high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, and a terminating device for containing the user's device). The '692 reference fails to teach a registering section from the user's device for a first signal format type which is used in the user's device, a retrieving section for a first signal format type which corresponds to information in a user's device according to a calling connection request from a user's device by referring to the information which is registered by the registering section, and a selecting section for selecting a first signal format which is used by the user's device according to a result in the retrieving section when data is transported from the user's device, a receiving and selecting section which receives a first signal format type information which is used in a device which receives a calling connection request from another VPN terminating device so as to respond to a notice from the notifying section and selects a first signal format type which is used in a user's device according to a format type information, user's device joins an virtual private network, IP

address of a user's device and a VPNID, and a notifying section for notifying contents of a registration to other VPN terminating device which controls that same VPNID as the user's device. Morinaga teaches a registering section from the user's device for a first signal format type which is used in the user's device, a retrieving section for a first signal format type which corresponds to information in a user's device according to a calling connection request from a user's device by referring to the information which is registered by the registering section, and a selecting section for selecting a first signal format which is used by the user's device according to a result in the retrieving section when data is transported from the user's device, a receiving and selecting section which receives a first signal format type information which is used in a device which receives a calling connection request from another VPN terminating device so as to respond to a notice from the notifying section and selects a first signal format type which is used in a user's device according to a format type information, and Oguchi teaches user's device joins an virtual private network, IP address of a user's device and a VPNID, and a notifying section for notifying contents of a registration to other VPN terminating device which controls that same VPNID as the user's device.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the

CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a registering section from the user's device for a first signal format type which is used in the user's device, a retrieving section for a first signal format type which corresponds to information in a user's device according to a calling connection request from a user's device by referring to the information which is registered by the registering section, and a selecting section for selecting a first signal format which is used by the user's device according to a result in the retrieving section when data is transported from the user's device).

Morinaga also teaches in column 5, lines 42-47 and 53-56, and in FIG. 2, Sheet 2 of 9, the central office line board (item 40, FIG. 2) is controlled by the central office line driver (item 39, FIG. 2), and the signal that the central office line driver transmits to or receives from the circuit exchange PBX1 via the central line office is processed by the switched circuit control portion (item 35, FIG. 2), and a signal that each of the LAN circuit drivers (item 37, FIG. 2) transmits or receives from the local area network via a LAN circuit board (item 38, FIG. 2) is processed by the LAN control portion (item 36, FIG. 2) (a receiving and selecting section which receives a first signal format type information which is used in a device which receives a calling connection request from another VPN terminating device so as to respond to a notice from the notifying section and selects a first signal format type which is used in a user's device according to a format type information). It would have been obvious to one of ordinary skill in the art at

the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information through a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (user's device joins a virtual private network, IP address of a user's device and a VPNID, and a notifying section for notifying contents of a registration to other VPN terminating device which controls that same VPNID as the user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claim 7, as discussed in the rejection of Claim 2, the '692 reference in view of Morinaga and Oguchi teaches an OVPN terminating device and a registering section that registers information for a user's own device which corresponds

to a first signal format which is used in a user's device with an IP address of a user's device and a VPNID. The '692 reference fails to teach a port identifier. Oguchi further teaches these limitations.

Oguchi further teaches in paragraphs [0045] and [0202], a virtual router correspondence table that includes port numbers (a port identifier). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claim 32, as discussed in the rejection of Claim 2, the '692 reference in view of Oguchi teaches an OVPN terminating device and a plurality of converting sections which are disposed to correspond to plural different signal formats, for converting a first signal format and a second signal format alternately under conditions in which a first signal format which is used by a user's device which joins an OVPN and a second signal which is used in an OVPN are different from each other. The '692 reference fails to teach a section for performing an alternate converting operation. Morinaga teaches these limitations.

In the same field of endeavor, Morinaga teaches in column 5, line 60 though column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323

protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a section for performing an alternate converting operation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

Claims 5 and 6 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Morinaga, Oguchi, and Zboril (Pub. No.: US 2003/0117945 A1), hereafter referred to as Zboril.

In regards to Claims 5 and 6, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for

Art Unit: 2619

high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a selecting section which selects for an alternate converting operation when a first signal format which is selected is different from a second signal format type, and a terminating device for containing the user's device). The '692 reference fails to teach a registering section for registering a first signal format type which is sent from a user's device so as to be used in the user's device, and selecting a first signal format type which can be used in a user's device handled between other VPN terminating device and the user's own device commonly according to registered contents, a user's device joins an virtual private network, IP address of a user's device and a VPNID, and a notifying and selecting section for notifying registered contents to another VPN terminating device which controls a device, a retrieving section retrieves information of a vacancy of a section for an operation in a one device and another device, and selecting an operation not occupied for one device and another device according to retrieving results

by a retrieving section. Morinaga teaches a registering section for registering a first signal format type which is sent from a user's device so as to be used in the user's device, and selecting a first signal format type which can be used in a user's device handled between other VPN terminating device and the user's own device commonly according to registered contents, and Oguchi teaches a user's device joins an virtual private network, IP address of a user's device and a VPNID, and a notifying and selecting section for notifying registered contents to another VPN terminating device which controls a device, and Zboril teaches a retrieving section retrieves information of a vacancy of a section for an operation in a one device and another device, and selecting an operation not occupied for one device and another device according to retrieving results by a retrieving section.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a registering section for registering a first signal format type which is sent from a user's device so as to be used in the user's

Art Unit: 2619

device, and selecting a first signal format type which can be used in a user's device handled between other VPN terminating device and the user's own device commonly according to registered contents). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information through a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (user's device joins a virtual private network, IP address of a user's device and a VPNID, and a notifying and selecting section for notifying registered contents to another VPN terminating device which controls a device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In the same field of endeavor, Zboril teaches in paragraphs [0130], [0156], and [0158], and in FIG. 1, Sheet 1 of 10, and in FIG. 3, Sheet 3 of 10, a continuous sequence of idle cells is sent on all inactive links that are indicated in TFU information, and idle cells are also inserted whenever no data cells are available on a data link (item 120, FIG. 3), and a link is brought into service by a multi-fiber transmitter (a retrieving section retrieves information of a vacancy of a section for an operation in a one device and another device, and selecting an operation not occupied for one device and another device according to retrieving results by a retrieving section). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Zboril since Zboril provides a method for each device in an optical network to exchange status information, providing the devices in the optical network of the '692 reference a method of information exchange that will allow thorough and rapid updates of network configuration changes and network failures.

Claims 11, 13, 16 and 22 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Newell, Jr. et al. (Patent No.: US 6,668,319 B1) and French et al. (Pub. No.: 2003/0041167 A1), hereafter referred to as Newell and French, respectively.

In regards to Claims 11 and 13, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N,

Art Unit: 2619

SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, and a terminating device for containing the user's device, and performing alternate converting operations). The '692 reference fails to teach a retrieving section for detecting whether or not there is a section for performing an operation, a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added. Newell teaches a retrieving section for detecting whether or not there is a section for performing an operation, and French teaches a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added.

In the same field of endeavor, Newell teaches in column 4, lines 11-27, devices exchange information concerning which protocol feature teaches does or does not support (a retrieving section for detecting whether or not there is a section for performing an operation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Newell since Newell provides a method in which devices in a network can inform other devices of network capabilities, allowing devices to make appropriate decision when routing requests, allowing the system of the '692 reference to performing routing based on the capabilities of other devices.

In the same field of endeavor, French teaches in paragraphs [0227] and [0275], assigned VPN IDs are stored as updated information within network objects, and a VPN creator ensures unique VPN IDs are created such that duplicate addresses can exist within a VPN that has an assigned VPN ID, and a server generates an IP address on behalf of its client (a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of French since French provides a system of maintaining and updating VPN IDs for IP addresses within virtual private networks, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claim 16, as discussed in the rejection of Claim 13, the '692 reference in view of Morinaga and French teaches receiving a response to a calling connection request and a signal format used by a user's device. The '692 reference fails to teach a notifying section to determine whether or not a format is used by another device and notify that the formats do not coincide each other for setting up a service to a user's device. Newell teaches these limitations.

In the same field of endeavor, Newell teaches in column 4, lines 11-27, devices exchange information concerning which protocol feature each does or does not support (a notifying section to determine whether or not a format is used by another device and notify that the formats do not coincide each other for setting up a service to a user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Newell since Newell provides a method in which devices in a network can inform other devices of network capabilities, allowing devices to make appropriate decision when routing requests, allowing the system of the '692 reference to performing routing based on the capabilities of other devices.

In regards to Claim 22, as discussed in the rejection of Claim 13, the '692 reference in view of French teaches an OVPN terminating device and a converting section. The '692 reference further teaches an operation in a user's own device. The '692 reference further teaches in paragraph [0008], page 3, lines 17-19, optical

transport network data entities are clients of SDH or SONET, implicitly teaching the components of these entities are already treated as clients in the optical network and can be implemented in client equipment (an operation in a user's own device).

Claims 12, 14, 15, 19, 20, 24, 26, 27 and 29 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Newell, French, and Morinaga.

In regards to Claim 12, as discussed in the rejection of Claim 11, the '692 reference in view of Newell and French teaches an OVPN and a plurality of converting sections, which are disposed as to correspond to plural different first signal formats, and for converting a first signal format and a second signal format alternatively under conditions in which a first signal format and a second signal format used by a user are different from each other. The '692 reference fails to teach a first signal format which is used by a sub-network is different from a second signal format used by a neighboring sub-network. Morinaga teaches these limitations.

In the same field of endeavor, Morinaga teaches in column 1, lines 29-33, and in column 4, lines 26-34, and in column 13, lines 10-18, and in FIG. 1, Sheet 1 of 9, an Internet telephony gateway, which has a gateway function of protocol conversion, and where a gateway (item GW1, FIG. 1) connects WAN packet-switched networks, local area networks, and circuit exchanges (a first signal format which is used by a sub-network is different from a second signal format used by a neighboring sub-network). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since

Morinaga teaches a system that efficiently connects multiple sub-networks of different protocols, allowing the system of the '692 reference to allow devices to accept data from different networks that vary by physical layer protocols, allowing the system of the '692 reference to be versatile in establishing direct physical connections to WANs, LANs, and telephone networks.

In regards to Claim 14, as discussed in the rejection of Claim 13, the '692 reference in view of Newell and French teaches a user's device having an IP address and a first signal format type information used by a user's device. The '692 reference fails to teach a selecting section for selecting a first signal format which is used by the user who receives a calling connection request according to a first signal format type information which is used by a user's device, included in a calling connection request, from which a calling connection request is transmitted when a calling connection request is received from a user's device, and a transmitting section for transmitting format type information which is selected by a selecting section to a user who receives a calling connection request together with a calling connection request. Morinaga teaches these limitations.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in column 12, lines 18-25, and in FIG. 2, Sheet 2 of 9, and in FIG. 5, Sheet 5 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a

calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided, and a request of setup is propagated to opposite site of the intended connection (item #311, FIG. 5) based on selection of CODEC and format (a selecting section for selecting a first signal format which is used by the user who receives a calling connection request according to a first signal format type information which is used by a user's device, included in a calling connection request, from which a calling connection request is transmitted when a calling connection request is received from a user's device, and a transmitting section for transmitting format type information which is selected by a selecting section to a user who receives a calling connection request together with a calling connection request). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters for use in efficient connection setup.

In regards to Claim 15, as discussed in the rejection of Claim 14, the '692 reference in view of Newell and French teaches a signal format and receiving a response to a calling connection request. The '692 reference fails to teach a notifying

section to determine whether or not a format is used by another device and notify that the formats do not coincide each other for setting up a service to a user's device.

Newell teaches these limitations.

In the same field of endeavor, Newell teaches in column 4, lines 11-27, devices exchange information concerning which protocol feature teaches does or does not support (a notifying section to determine whether or not a format is used by another device and notify that the formats do not coincide each other for setting up a service to a user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Newell since Newell provides a method in which devices in a network can inform other devices of network capabilities, allowing devices to make appropriate decision when routing requests, allowing the system of the '692 reference to performing routing based on the capabilities of other devices.

In regards to Claims 19 and 20, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OTU), and where the payload to be carried fro the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-

55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, and a terminating device for containing the user's device, and performing alternate converting operations). The '692 reference fails to teach a retrieving section for detecting whether or not there is a section for performing an operation, a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added, a section for employing a converting section for performing an operation of a first signal format and a second signal format which correspond to an IP address which is contained in a calling connection request which is transmitted from a communication flowing a calling connection request by referring to a registering section when a calling connection request arrives from a user's device. Newell teaches a retrieving section for detecting whether or not there is a section for performing an operation, and French teaches a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added, and Morinaga teaches a section for employing a converting

Art Unit: 2619

section for performing an operation of a first signal format and a second signal format which correspond to an IP address which is contained in a calling connection request which is transmitted from a communication flowing a calling connection request by referring to a registering section when a calling connection request arrives from a user's device.

In the same field of endeavor, Newell teaches in column 4, lines 11-27, devices exchange information concerning which protocol feature teaches does or does not support (a retrieving section for detecting whether or not there is a section for performing an operation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Newell since Newell provides a method in which devices in a network can inform other devices of network capabilities, allowing devices to make appropriate decision when routing requests, allowing the system of the '692 reference to performing routing based on the capabilities of other devices.

In the same field of endeavor, French teaches in paragraphs [0227] and [0275], assigned VPN IDs are stored as updated information within network objects, and a VPN creator ensures unique VPN IDs are created such that duplicate addresses can exist within a VPN that has an assigned VPN ID, and a server generates an IP address on behalf of its client (a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added). It would have been obvious to one of ordinary skill

in the art at the time of the invention to combine the invention of the '692 reference with the invention of French since French provides a system of maintaining and updating VPN IDs for IP addresses within virtual private networks, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a section for employing a converting section for performing an operation of a first signal format and a second signal format which correspond to an IP address which is contained in a calling connection request which is transmitted from a communication flowing a calling connection request by referring to a registering section when a calling connection request arrives from a user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and

transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

In regards to Claim 24, as discussed in the rejections of Claim 13, the '692 reference in view of French teaches an OVPN terminating device and a plurality of converting sections which are disposed to correspond to plural different signal formats, for converting a first signal format and a second signal format alternately under conditions in which a first signal format which is used by a user's device which joins an OVPN and a second signal which is used in an OVPN are different from each other. The '692 reference fails to teach a section for performing an alternate converting operation. Morinaga teaches these limitations.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a section for performing an alternate converting operation). It would have been obvious to one of ordinary skill in the art at

the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

In regards to Claims 26 and 27, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, and a terminating device for containing the user's device, and performing alternate converting operations). The '692 reference fails to teach a retrieving section

for detecting whether or not there is a section for performing an operation, a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added, a detection section for detecting whether or not a user's device is connected, and a receiving and determining section for receiving a test signal which is transmitted via a data channel by using an identifier from a user's device and determining a first signal format type which belongs to a user's device. Newell teaches a retrieving section for detecting whether or not there is a section for performing an operation, and French teaches a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added, and Morinaga teaches a detection section for detecting whether or not a user's device is connected, and a receiving and determining section for receiving a test signal which is transmitted via a data channel by using an identifier from a user's device and determining a first signal format type which belongs to a user's device.

In the same field of endeavor, Newell teaches in column 4, lines 11-27, devices exchange information concerning which protocol feature teaches does or does not support (a retrieving section for detecting whether or not there is a section for performing an operation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the

invention of Newell since Newell provides a method in which devices in a network can inform other devices of network capabilities, allowing devices to make appropriate decision when routing requests, allowing the system of the '692 reference to performing routing based on the capabilities of other devices.

In the same field of endeavor, French teaches in paragraphs [0227] and [0275], assigned VPN IDs are stored as updated information within network objects, and a VPN creator ensures unique VPN IDs are created such that duplicate addresses can exist within a VPN that has an assigned VPN ID, and a server generates an IP address on behalf of its client (a generating section for generating an IP address and a VPNID to a user's device, and a registering section for registering an IP address and a VPNID generated by a generating section and information used by a user's device to which an IP address and a VPNIS are added). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of French since French provides a system of maintaining and updating VPN IDs for IP addresses within virtual private networks, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In the same field of endeavor, Morinaga teaches in column 5, line 60 though column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to

be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided, and, in column 9, lines 41-54, and in FIG. 3, Sheet 3 of 9, a gateway receives a calling signal and a target parameter setting a table is looked up as to judge parameters (a detection section for detecting whether or not a user's device is connected, and a receiving and determining section for receiving a test signal which is transmitted via a data channel by using an identifier from a user's device and determining a first signal format type which belongs to a user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

In regards to Claim 29, as discussed in the rejection of Claim 27, the '692 reference teaches a converting section and an alternate converting operation. The '692 reference further teaches an operation in a user's own device. The '692 reference further teaches in paragraph [0008], page 3, lines 17-19, optical transport network data entities are clients of SDH or SONET, implicitly teaching the components of these

entities are already treated as clients in the optical network and can be implemented in client equipment (an operation in a user's own device).

Claim 17 is rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Newell, French, and Jurkevich et al. (Patent Number: 5,282,207), hereafter referred to as Jurkevich.

In regards to Claim 17, as discussed in the rejection of Claim 13, the '692 reference in view of Newell and French teaches a converting section for performing an alternate converting operation and a retrieving result by a retrieving section indicates that there is not a section for performing alternate converting operation and generating an IP address and a VPNID for a user's device.

Jurkevich teaches in column 37, lines 36-60, certain links experiencing server congestion may cause a request to change a format to send data on new bandwidth, and if a request from more bandwidth is approved, additional bandwidth is allocated as requested (an inquiring section for inquiring whether or not it is possible to change a vacant section to user's device which is under operation, and a requesting a generating section for requesting for changing a section for performing alternate operation to other user device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Jurkevich since Jurkevich provides a method of acquiring new network resources when previous network resource become inadequate, allowing the system of the '692

reference to adjust to new users attempting to establish connections and send data and for current users that are changing their data rate requirements.

Claim 28 is rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Newell, French, Morinaga, and further in view of Oguchi.

In regards to Claim 28, as discussed in the rejections of Claim 27, the '692 reference in view of Newell, French, and Morinaga teaches a registering section and a user's own device which corresponds to a first signal format type used in the user's device. The '692 reference fails to teach a port identifier. Oguchi further teaches these limitations.

In the same field of endeavor, Oguchi teaches in paragraphs [0045] and [0202], a virtual router correspondence table that includes port numbers (a port identifier). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

Claims 34, 35, 36 and 37 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Takagi et al. (Pub. No.: US 2003/0043857 A1) (hereafter referred to as Takagi) and Oguchi.

In regards to Claims 34 and 35, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a transmitting section processing a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a transmitting section processing an encapsulated signal which is encapsulated by a second signal format which is transmitted from an optical network to a user's device by de-encapsulating to a first signal format and a terminating device for containing the user's device). The '692 reference fails to teach a multiplying section for multiplying a plurality of signals by a second signal format which are directed to a common destination, and a transmitting section to a user's device is provided with a

Art Unit: 2619

separating section for the multiplied signal by the multiplying section into a plurality of signals, and VPN. Takagi teaches a multiplying section for multiplying a plurality of signals by a second signal format which are directed to a common destination, and a transmitting section to a user's device is provided with a separating section for the multiplied signal by the multiplying section into a plurality of signals, and Oguchi teaches VPN.

In the same field of endeavor, Takagi teaches in paragraphs [0076] though [0084], and in FIG. 1, FIG. 2, FIG. 3, and FIG. 4, a system where a multiple ATM cells are combined and processed and encapsulated for transmission through an optical fiber to a single base station, and where a base station extracts the multiple ATM cells from the encapsulation (a multiplying section for multiplying a plurality of signals by a second signal format which are directed to a common destination, and a transmitting section to a user's device is provided with a separating section for the multiplied signal by the multiplying section into a plurality of signals). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Takagi since Takagi teaches a detailed method of combining data unit prior to encapsulation and transmission across an optical transmission medium so that transmission speeds are maintained, which can be incorporated into the system of the '692 reference so that overhead is reduced and transmission speeds are maintained across an optical network.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing

information through a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claims 36 and 37, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges of a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's

device and a second signal format which is used in the network are different from each other, a transmitting section processing a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a transmitting section processing an encapsulated signal which is encapsulated by a second signal format which is transmitted from an optical network to a user's device by de-encapsulating to a first signal format and a terminating device for containing the user's device). The '692 reference fails to teach a multiplying section for multiplying a plurality of signals by a second signal format which are directed to a common destination, and a transmitting section to a user's device is provided with a separating section for the multiplied signal by the multiplying section into a plurality of signals, and VPN. Takagi teaches a dividing and encapsulating section for dividing and encapsulating a series of signals according to a first signal format into a plurality of signals according to a second signal format, and a restoring section for restoring a plurality of signals which are divided by a dividing and encapsulating section into a series of signals, and Oguchi teaches VPN.

In the same field of endeavor, Takagi teaches in paragraphs [0076] though [0084], and in FIG. 1, FIG. 2, FIG. 3, and FIG. 4, a system where a multiple ATM cells are combined and processed and encapsulated for transmission though an optical fiber to a single base station, and where a base station extracts the multiple ATM cells from the encapsulation (a dividing and encapsulating section for dividing and encapsulating a series of signals according to a first signal format into a plurality of signals according to a second signal format, and a restoring section for restoring a plurality of signals which

Art Unit: 2619

are divided by a dividing and encapsulating section into a series of signals). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Takagi since Takagi teaches a detailed method of combining data unit prior to encapsulation and transmission across an optical transmission medium so that transmission speeds are maintained, which can be incorporated into the system of the '692 reference so that overhead is reduced and transmission speeds are maintained across an optical network.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information through a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

Claim 38 is rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Takagi, Oguchi, and further in view of Morinaga.

In regards to Claim 38, as discussed in the rejection of Claim 34, the '692 reference in view of Oguchi teaches an OVPN terminating device and a plurality of converting sections which are disposed to correspond to plural different signal formats, for converting a first signal format and a second signal format alternately under conditions in which a first signal format which is used by a user's device which joins an OVPN and a second signal which is used in an OVPN are different from each other. The '692 reference fails to teach a section for performing an alternate converting operation. Morinaga teaches these limitations.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a section for performing an alternate converting operation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to

be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

Claims 40, 43 and 46 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Oguchi.

In regards to Claims 40, 43 and 46, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a transmitting section for transmitting a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a transmitting section for transmitting an encapsulated signal

which is encapsulated by a second signal format which is transmitted from an optical network to a user's device by de-encapsulating to a first signal format, and a terminating device for containing the user's device). The '692 reference fails to teach VPN. Oguchi teaches VPN.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information though a level-2 tunnel established between edge routers, which can involves a host having an IP address, and then generate routing tables for that VPN-ID (VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

Claims 41, 42, 44 and 45 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Oguchi, and further in view of Takagi.

In regards to Claim 41 and 44, as discussed in the rejections of Claim 40 and 43, the '692 reference in view of Oguchi teaches a transmitting section to an OVPN. The '692 reference fails to teach a multiplying section for multiplying a plurality of signals according to a second signal format. Takagi teaches these limitations.

In the same field of endeavor, Takagi teaches in paragraphs [0076] through [0084], and in FIG. 1, FIG. 2, FIG. 3, and FIG. 4, a system where a multiple ATM cells are combined and processed and encapsulated for transmission through an optical fiber to a single base station, and where a base station extracts the multiple ATM cells from the encapsulation (a multiplying section for multiplying a plurality of signals by a second signal format which are directed to a common destination, and a transmitting section to a user's device is provided with a separating section for the multiplied signal by the multiplying section into a plurality of signals). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Takagi since Takagi teaches a detailed method of combining data unit prior to encapsulation and transmission across an optical transmission medium so that transmission speeds are maintained, which can be incorporated into the system of the '692 reference so that overhead is reduced and transmission speeds are maintained across an optical network.

In regards to Claim 42 and 45, as discussed in the rejections of Claim 40 and 43, the '692 reference in view of Oguchi teaches a transmitting section to an OVPN. The '692 reference fails to teach a dividing and encapsulating section for dividing and encapsulating a series of signals according to a first signal format into a plurality of signals according to a second signal format. Takagi teaches these limitations.

In the same field of endeavor, Takagi teaches in paragraphs [0076] through [0084], and in FIG. 1, FIG. 2, FIG. 3, and FIG. 4, a system where a multiple ATM cells

Art Unit: 2619

are combined and processed and encapsulated for transmission through an optical fiber to a single base station, and where a base station extracts the multiple ATM cells from the encapsulation (a dividing and encapsulating section for dividing and encapsulating a series of signals according to a first signal format into a plurality of signals according to a second signal format). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Takagi since Takagi teaches a detailed method of combining data unit prior to encapsulation and transmission across an optical transmission medium so that transmission speeds are maintained, which can be incorporated into the system of the '692 reference so that overhead is reduced and transmission speeds are maintained across an optical network.

Claims 48-50 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Morinaga and French.

In regards to Claims 48 and 49, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-

55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a transmitting section for transmitting a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a transmitting section for transmitting an encapsulated signal which is encapsulated by a second signal format which is transmitted from an optical network to a user's device by de-encapsulating to a first signal format, and a terminating device for containing the user's device). The '692 reference fails to teach a receiving and transmitting section for receiving a notice that a user's device is connected to a base point device via a control channel from a base point device which is disposed between a user's device and a network, VPN, and transmitting an IP address and a VPNID which are allocated to a user's device according to a base point device. Morinaga teaches a receiving and transmitting section for receiving a notice that a user's device is connected to a base point device via a control channel from a base point device which is disposed between a user's device and a network, and French teaches VPN and transmitting an IP address and a VPNID which are allocated to a user's device according to a base point device.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided, and, in column 9, lines 41-54, and in FIG. 3, Sheet 3 of 9, a gateway receives a calling signal and a target parameter setting a table is looked up as to judge parameters (a receiving and transmitting section for receiving a notice that a user's device is connected to a base point device via a control channel from a base point device which is disposed between a user's device and a network). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

In the same field of endeavor, French teaches in paragraphs [0227] and [0275], assigned VPN IDs are stored as updated information within network objects, and a VPN creator ensures unique VPN IDs are created such that duplicate addresses can exist

within a VPN that has an assigned VPN ID, and a server generates an IP address on behalf of its client (transmitting an IP address and a VPNID which are allocated to a user's device according to a base point device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of French since French provides a system of maintaining and updating VPN IDs for IP addresses within virtual private networks, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claim 50, as discussed in the rejection of Claim 49, the '692 reference in view of Morinaga and French teaches a receiving section and a transmitting section, a base point device, and an IP address and a VPNID. The '692 reference fails to teach receiving a receipt confirmation, and transmitting a final connection confirmation for notifying the receipt of a receipt confirmation. Morinaga further teaches these limitations.

Morinaga further teaches in column 11, lines 50-56, and in column 12, lines 19-25, and in FIG. 5, Sheet 5 of 9, in step #301 (FIG. 5) a RECEPTION OF SETUP occurs, and then, in the connection process step # 311 (FIG. 5), a TRANSMISSION OF CONN is received, and then a transmission of RECEPTION OF CONN-ACK (receiving a receipt confirmation, and transmitting a final connection confirmation for notifying the receipt of a receipt confirmation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with

the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

Claim 51 is rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Morinaga, French, and further in view of Newell.

In regards to Claim 51, as discussed in the rejection of Claim 50, the '692 reference in view of Morinaga and French teaches a receiving and retrieving section, an alternate converting section, a first signal format type information which is employed by a user's device according to a control channel after a final connection confirmation is transmitted. The '692 reference fails to teach retrieving whether or not there is a converting section for performing an operation, and a retrieving result indicating there is a section for performing an operation, a registering section for registering an IP address and a VPNID which are allocated to a user's device. Newell teaches retrieving whether or not there is a converting section for performing an operation, and a retrieving result indicating there is a section for performing an operation, and French teaches a registering section for registering an IP address and a VPNID which are allocated to a user's device

In the same field of endeavor, Newell teaches in column 4, lines 11-27, devices exchange information concerning which protocol feature teaches does or does not support (retrieving whether or not there is a converting section for performing an

operation, and a retrieving result indicating there is a section for performing an operation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Newell since Newell provides a method in which devices in a network can inform other devices of network capabilities, allowing devices to make appropriate decision when routing requests, allowing the system of the '692 reference to performing routing based on the capabilities of other devices.

In the same field of endeavor, French teaches in paragraphs [0227] and [0275], assigned VPN IDs are stored as updated information within network objects, and a VPN creator ensures unique VPN IDs are created such that duplicate addresses can exist within a VPN that has an assigned VPN ID, and a server generates an IP address on behalf of its client (a registering section for registering an IP address and a VPNID which are allocated to a user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of French since French provides a system of maintaining and updating VPN IDs for IP addresses within virtual private networks, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

Claims 58, 59, 64-66 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Miyabe (Patent No.: US 7,024,113 B2) (hereafter referred to as Miyabe) and Oguchi.

In regards to Claims 58, 59 and 66, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a transmitting section for transmitting a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a transmitting section for transmitting an encapsulated signal which is encapsulated by a second signal format which is transmitted from an optical network to a user's device by de-encapsulating to a first signal format, and a terminating device for containing the user's device, and a transmitting section for transmitting a plurality of optical wavelength signals to an optical network). The '692 reference fails to teach a multiplying and transmitting section for multiplying and transmitting a plurality of

Art Unit: 2619

optical wavelength signals which are used in a user's device to an optical network, a separating and transmitting section for separating and transmitting multiplied optical wavelength signals which arrive from an optical network, and separating and transmitting a multiplied optical wavelength signals which arrive from a base point device so as to transmit to a predetermined course according to information which is notified from a notifying section, a notifying section for notifying an optical network of information for a wavelength which are transmitted under a multiplied condition so as to be used in a plurality of devices, and VPN. Miyabe teaches a multiplying and transmitting section for multiplying and transmitting a plurality of optical wavelength signals which are used in a user's device to an optical network, a separating and transmitting section for separating and transmitting multiplied optical wavelength signals which arrive from an optical network, and separating and transmitting a multiplied optical wavelength signals which arrive from a base point device so as to transmit to a predetermined course according to information which is notified from a notifying section, a notifying section for notifying an optical network of information for a wavelength which are transmitted under a multiplied condition so as to be used in a plurality of devices, and Oguchi teaches VPN.

In the same field of endeavor, Miyabe teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength multiplexer (item 9, FIG. 19) on an output side of an optical switch (a multiplying and transmitting section for multiplying and transmitting

a plurality of optical wavelength signals which are used in a user's device to an optical network).

Miyabe also teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength demultiplexer (item 7, FIG. 19) on an input side of an optical switch which can receive signals from intermediate network devices (a separating and transmitting section for separating and transmitting multiplied optical wavelength signals which arrive from an optical network, and separating and transmitting a multiplied optical wavelength signals which arrive from a base point device so as to transmit to a predetermined course according to information which is notified from a notifying section).

Miyabe also teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a an OXC5 (OPTICAL XC5, FIG. 24) transmits to OXC4 (OPTICAL XC4, FIG. 24), a wavelength notification message indicating a wavelength has been reserved for a new route, where the wavelength notification message includes a path identifier and a wavelength value for notification, and upon receipt of this message, OXC4 stores the wavelength value into a table entry corresponding to a path identifier of the new route in a wavelength management table (item 60, FIG. 19), where the entire content of the wavelength management table become to have effective values and the contents are reflected to an optical switch (a notifying section for notifying an optical network of information for a wavelength which are transmitted under a multiplied condition so as to be used in a plurality of devices). It would have been obvious to one of ordinary skill in

the art at the time of the invention to combine the invention of the '692 reference with the invention of Miyabe since Miyabe provides a system that details the reception, transmission, and processing of wavelength signals in an optical network and how to update routing information to devices on such a network, and can be incorporated the system of the '692 reference to provide prompt management table updates utilizing wavelength division components.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information though a level-2 tunnel established between edge routers, which can involves a host having an IP address, and then generate routing tables for that VPN-ID (VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claims 64 and 65, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a

Art Unit: 2619

frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a transmitting section for transmitting a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a terminating device for containing the user's device). The '692 reference fails to teach converting a series of serial signals into a plurality of parallel signals and covering a plurality of parallel signals into a series of serial signals, and VPN. Miyabe teaches converting a series of serial signals into a plurality of parallel signals and covering a plurality of parallel signals into a series of serial signals, and Oguchi teaches VPN.

In the same field of endeavor, Miyabe teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength multiplexer (item 9, FIG. 19) on an output side of an optical switch, and a wavelength demultiplexer (item 7, FIG. 19) on an input side of an optical switch which can receive signals from intermediate network devices

Art Unit: 2619

(converting a series of serial signals into a plurality of parallel signals and covering a plurality of parallel signals into a series of serial signals). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Miyabe since Miyabe provides a system that details the reception, transmission, and processing of wavelength signals in an optical network and how to update routing information to devices on such a network, and can be incorporated the system of the '692 reference to provide prompt management table updates utilizing wavelength division components.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information through a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

Claims 60-63 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Miyabe, Miller et al. (Patent No.: US 6,212,568 B1) (hereafter referred to as Miller), and Oguchi.

In regards to Claim 60, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a transmitting section for transmitting a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a transmitting section for transmitting an encapsulated signal which is encapsulated by a second signal format which is transmitted from an optical network to a user's device by de-encapsulating to a first signal format, and a terminating device for containing the user's device, and a transmitting section for transmitting a plurality of optical wavelength signals to an optical network). The '692 reference fails to teach a converting and transmitting section for converting a serial signal which is transmitted

from a user's device into a plurality of parallel signals so as to transmit to a network, a converting and transmitting section for converting a plurality of parallel signals which arrive from a network to a serial signal so as to transmit to a user's device a notifying section for notifying that information for a topology of parallel signals and information that the serial signals are converted to parallel signals, and VPN. Miyabe teaches a converting and transmitting section for converting a serial signal which is transmitted from a user's device into a plurality of parallel signals so as to transmit to a network, a converting and transmitting section for converting a plurality of parallel signals which arrive from a network to a serial signal so as to transmit to a user's device, Miller teaches a notifying section for notifying that information for a topology of parallel signals and information that the serial signals are converted to parallel signals, Oguchi teaches VPN.

In the same field of endeavor, Miyabe teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength demultiplexer (item 7, FIG. 19) on an input side of an optical switch which can receive signals from intermediate network devices (a converting and transmitting section for converting a serial signal which is transmitted from a user's device into a plurality of parallel signals so as to transmit to a network).

Miyabe also teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength multiplexer (item 9, FIG. 19) on an output side of an optical switch (a converting and transmitting section for converting a plurality of parallel signals which

Art Unit: 2619

arrive from a network to a serial signal so as to transmit to a user's device). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Miyabe since Miyabe provides a system that details the reception, transmission, and processing of wavelength signals in an optical network and how to update routing information to devices on such a network, and can be incorporated the system of the '692 reference to provide prompt management table updates utilizing wavelength division components.

In the same field of endeavor, Miller teaches in column 11, lines 4-11, a frame includes a frames-follow flag which indicates that multiple frames together comprise a "super frame" (a notifying section for notifying that information for a topology of parallel signals and information that the serial signals are converted to parallel signals). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Miller since Miller provides a method of conveying how information has been arranged, allowing quicker processing of data units since more detailed information is provided to devices that receive the encapsulated data unit in the system of the '692 reference.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information though a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi

since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In regards to Claim 61, as discussed in the rejection of Claim 60, the '692 reference in view of Miyabe, Miller, and Oguchi teaches an optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, and a terminating device for containing the user's device and information which is notified from a notifying section. The '692 reference fails to teach an inputting section for inputting parallel signals which are divided from a series of serial signals. Miyabe further teaches these limitations.

Miyabe further teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength multiplexer (item 9, FIG. 19) on an output side of an optical switch (an inputting section for inputting parallel signals which are divided from a series of serial signals). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Miyabe since Miyabe provides a system that details the reception, transmission, and processing

of wavelength signals in an optical network and how to update routing information to devices on such a network, and can be incorporated the system of the '692 reference to provide prompt management table updates utilizing wavelength division components.

In regards to Claims 62 and 63, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, and a terminating device for containing the user's device,). The '692 reference fails to teach a multiplying and transmitting section for multiplying a parallel signal which is converted from a serial signal to transmit to a network, a separating and transmitting section for separating multiplied wavelength signals which arrive from a network into

parallel signals and converting parallel signals into serial signals so as to transmit to a device, information that signals are transmitted under wavelength-multiplied condition, a notifying section for notifying that information for a topology of parallel signals, and VPN. Miyabe teaches a multiplying and transmitting section for multiplying a parallel signal which is converted from a serial signal to transmit to a network, a separating and transmitting section for separating multiplied wavelength signals which arrive from a network into parallel signals and converting parallel signals into serial signals so as to transmit to a device, information that signals are transmitted under wavelength-multiplied condition, and Miller teaches a notifying section for notifying that information for a topology of parallel signals, and Oguchi teaches VPN.

In the same field of endeavor, Miyabe teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength multiplexer (item 9, FIG. 19) on an output side of an optical switch (a multiplying and transmitting section for multiplying a parallel signal which is converted from a serial signal to transmit to a network).

Miyabe also teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a wavelength demultiplexer (item 7, FIG. 19) on an input side of an optical switch which can receive signals from intermediate network devices (a separating and transmitting section for separating multiplied wavelength signals which arrive from a network into parallel signals and converting parallel signals into serial signals so as to transmit to a device).

Miyabe also teaches in column 19, lines 44-52, and in column 12, line 63 through column 13, line 8, and in FIG. 19, Sheet 19 of 28, and in FIG. 24, Sheet 23 of 28, a an OXC5 (OPTICAL XC5, FIG. 24) transmits to OXC4 (OPTICAL XC4, FIG. 24), a wavelength notification message indicating a wavelength has been reserved for a new route, where the wavelength notification message includes a path identifier and a wavelength value for notification, and upon receipt of this message, OXC4 stores the wavelength value into a table entry corresponding to a path identifier of the new route in a wavelength management table (item 60, FIG. 19), where the entire content of the wavelength management table become to have effective values and the contents are reflected to an optical switch (information that signals are transmitted under wavelength-multiplied condition). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Miyabe since Miyabe provides a system that details the reception, transmission, and processing of wavelength signals in an optical network and how to update routing information to devices on such a network, and can be incorporated the system of the '692 reference to provide prompt management table updates utilizing wavelength division components.

In the same field of endeavor, Miller teaches in column 11, lines 4-11, a frame includes a frames-follow flag which indicates that multiple frames together comprise a "super frame" (a notifying section for notifying that information for a topology of parallel signals). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Miller since

Art Unit: 2619

Miller provides a method of conveying how information has been arranged, allowing quicker processing of data units since more detailed information is provided to devices that receive the encapsulated data unit in the system of the '692 reference.

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information though a level-2 tunnel established between edge routers, which can involve a host having an IP address, and then generate routing tables for that VPN-ID (VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

Claim 67 is rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Miyabe, Oguchi, and further in view of Tosey et al. (Patent No.: US 6,392,990 B1), hereafter referred to as Tosey.

In regards to Claim 67, as discussed in the rejection of Claim 58, the '692 reference in view of Miyabe and Oguchi teaches a user's device and an OVPN. The '692 reference fails to teach a separating section for separating a user's device and a network, and a returning section for returning a test beam which is transmitted from a network. Tosey teaches these limitations.

In the same field of endeavor, Tosey teaches in column 7, lines 14-17 and 29-31, and in FIG. 2, Sheet 2 of 11, a network computing device (item 21, FIG. 2) that is part of a network of other network devices, and this network is separated from a WAN of users by a router (item 24, FIG. 2), and where the network computing device (item 21, FIG. 2) executes a link test to a peer network device, such as the router (item 24, FIG. 2), and determines if a peer network device has returned a response (a separating section for separating a user's device and a network, and a returning section for returning a test beam which is transmitted from a network). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Tosey since Tosey provides a method of testing connections of a network device to other network devices, including devices that connect it to another network and its users, and where the device being tested can respond to confirm connectivity, including connectivity to a network of users, allowing the system of the '692 reference to detect network failures and respond by developing paths to avoid them and reestablish connectivity.

Claim 68 is rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Miyabe, Oguchi, and further in view of Morinaga.

In regards to Claim 68, as discussed in the rejection of Claim 59, the '692 reference in view of Oguchi teaches an OVPN terminating device and a plurality of converting sections which are disposed to correspond to plural different signal formats, for converting a first signal format and a second signal format alternately under

conditions in which a first signal format which is used by a user's device which joins an OVPN and a second signal which is used in an OVPN are different from each other. The '692 reference fails to teach a section for performing an alternate converting operation. Morinaga teaches these limitations.

In the same field of endeavor, Morinaga teaches in column 5, line 60 through column 6, line 6, and in column 7, lines 45-59, and in FIG. 2, Sheet 2 of 9, a H.323 protocol portion (item 33, FIG. 2), a CODEC (item 34, FIG. 2), and a call control portion (item 31, FIG. 2), that operate where a transmission format to be used in accordance with each user information of a calling side is registered as a circuit, and a CODEC to be used in accordance with each user information of the calling side is registered as the CODEC, and if the user information of a calling side is accompanied by ON flag in the target parameter setting table, the reference table of the user information of the calling side and communication method is looked up, so that the transmission format to be used as the communication method is decided (a section for performing an alternate converting operation). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Morinaga since Morinaga teaches a system that involves storing user information and transmission parameters, allowing the system of the '692 reference to be able to adjust routing parameters that best serve a user's preferences or QoS requirements.

Claims 70-73 are rejected under 35 U.S.C. 103(a) as being unpatentable over the '692 reference in view of Oguchi and Tosey.

In regards to Claims 70, 71 and 73, the '692 reference teaches in paragraph [0005], page 2, lines 40-43, 48-49 and 52-55, an optical transport network is intended to be a multi-service network that supports a wide variety of layers including SDH STM-N, SONET, ATM, IP, as well as other formats, to provide a universal transport medium for high bandwidth services, where client signals are mapped into the payload area of a frame structure called an optical transport unit (OUT), and where the payload to be carried from the client, i.e. the client signal, which may be ATM, SDH, STM-N, or IP, is mapped into an optical payload unit (OPU), and, in paragraph [0019], page 5, lines 50-55, and in Fig. 1, page 18, a node N1 (Fig. 1), a node SNA (Fig. 1), a node SNB (Fig. 1), and a node N1 (Fig. 1) at the edges a conventional SDH network (optical network, and a plurality of converting sections, which are disposed so as to correspond to plural different first signal formats, for converting a first signal format and a second signal format alternatively under conditions in which the first signal format is used by a user's device and a second signal format which is used in the network are different from each other, a transmitting section for transmitting a first signal format which is transmitted from a user's device to an optical network by encapsulating a first signal format by a second signal format, and a terminating device for containing the user's device). The '692 reference fails to teach a recording section for recording a group for a device which relates to a common VPNID, and VPN, a selecting section for detecting an occurrence of a failure in a control channel and a data channel, a requesting section requesting that

other device in a same group should perform processes which is supposed to be performed by original device which has a failure in a control channel with reference to a recoding section when detecting section detects an occurrence of a failure. Oguchi teaches a recording section for recording a group for a device witch relates to a common VPNID, and VPN, and Tosey teaches a selecting section for detecting an occurrence of a failure in a control channel and a data channel, a requesting section requesting that other device in a same group should perform processes which is supposed to be performed by original device which has a failure in a control channel with reference to a recoding section when detecting section detects an occurrence of a failure

In the same field of endeavor, Oguchi teaches in paragraph [0065], [0067], [0083], [0085], and [0143], virtual routers having the same VPN-ID exchange routing information though a level-2 tunnel established between edge routers, which can involves a host having an IP address, and then generate routing tables for that VPN-ID (a recording section for recording a group for a device witch relates to a common VPNID, and VPN). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Oguchi since Oguchi provides a method of establishing a virtual network and distributing the necessary information to establish and maintain such a virtual network, allowing the optical network of the '692 reference to provide optical VPN services to customers and provide the privacy, robustness, and cost effectiveness of virtual private networks.

In the same field of endeavor, Tosey teaches in column 8, lines 59-67, and in column 9, lines 12-32, and in FIG. 6B, Sheet 9 of 11, a failure occurs in the connection between a computing device (item 163, FIG. 6B) and a router A (item 172, FIG. 6B), which causes the computing device to switch communications through a new interface that connects to a WAN through router B (item 174, FIG. 6B), and a routing protocol, such as RIP or OSPF, is used to notify external network components that packets must be rerouted to the new network interface that is connected to the WAN through router B (item 174, FIG. 6B) (a selecting section for detecting an occurrence of a failure in a control channel and a data channel, a requesting section requesting that other device in a same group should perform processes which is supposed to be performed by original device which has a failure in a control channel with reference to a recoding section when detecting section detects an occurrence of a failure). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Tosey since Tosey provides a method of testing connections of a network device to other network devices, including devices that connect it to another network and its users, and where the device being tested can respond to confirm connectivity, including connectivity to a network of users, allowing the system of the '692 reference to detect network failures and respond by developing paths to avoid them and reestablish connectivity.

In regards to Claim 72, as discussed in the rejection of Claim 58, the '692 reference in view of Oguchi and Tosey teaches a user's device and an OVPN. The '692

reference fails to teach a separating section for separating a user's device and a network, and a returning section for returning a test beam which is transmitted from a network. Tosey teaches these limitations.

In the same field of endeavor, Tosey teaches in column 7, lines 14-17 and 29-31, and in FIG. 2, Sheet 2 of 11, a network computing device (item 21, FIG. 2) that is part of a network of other network devices, and this network is separated from a WAN of users by a router (item 24, FIG. 2), and where the network computing device (item 21, FIG. 2) executes a link test to a peer network device, such as the router (item 24, FIG. 2), and determines if a peer network device has returned a response (a separating section for separating a user's device and a network, and a returning section for returning a test beam which is transmitted from a network). It would have been obvious to one of ordinary skill in the art at the time of the invention to combine the invention of the '692 reference with the invention of Tosey since Tosey provides a method of testing connections of a network device to other network devices, including devices that connect it to another network and its users, and where the device being tested can respond to confirm connectivity, including connectivity to a network of users, allowing the system of the '692 reference to detect network failures and respond by developing paths to avoid them and reestablish connectivity.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure. Rosengard et al. (Patent No.: US 7,013,318 B2) teaches in the

Art Unit: 2619

abstract a method of buffering cells in a queue and the multiple cells in the buffer are encapsulated together.
